

# Timekeeper

Updated: 2018-09-06

A global singleton tasked with keeping track of global clocks in the scene. One and only one Timekeeper is required per scene.

The Timekeeper class follows the singleton design pattern. That's a complicated way of saying it's an object that can and must exist only once per scene. This object, called the instance, can be accessed from anywhere via `Timekeeper.instance`.

## Properties

```
bool debug { get; set; }
```

Determines whether Chronos should display debug messages and gizmos in the editor.

```
int maxParticleLoops { get; set; }
```

The maximum loops during which particle systems should be allowed to run before resetting.

This property is a temporary performance hotfix until a better solution to particle simulation is found. You can set it to 0 or less for infinite loops, but expect some performance problems.

## Methods

```
IEnumerable<GlobalClock> clocks { get; }
```

An enumeration of all the global clocks on the timekeeper.

```
bool HasClock(string key)
```

Indicates whether the timekeeper has a global clock with the specified key.

```
GlobalClock Clock(string key)
```

Returns the global clock with the specified key.

```
GlobalClock AddClock(string key)
```

Adds a global clock with the specified key and returns it.

```
void RemoveClock(string key)
```

Removes the global clock with the specified key.

## Examples

Speed up the "Monsters" global clock if it exists:

```
if (Timekeeper.instance.HasClock("Monsters"))
{
    Timekeeper.instance.Clock("Monsters").localTimeScale = 2;
}
```

Create a new clock for enemies and apply it to all Enemy GameObjects:

```
Clock enemiesClock = Timekeeper.instance.AddClock("Enemies");
Enemy[] enemies = GameObject.FindObjectsOfType<Enemy>();

foreach (Enemy enemy in enemies)
{
    // This assumes every enemy already has a Timeline component
    Timeline timeline = enemy.GetComponent<Timeline>();
    timeline.mode = TimelineMode.Global;
    timeline.globalClockKey = enemiesClock.key;
}
```

Next

**Clock** →

An abstract base component that provides common timing functionality to all types of clocks.
