

TimelineChild

Updated: 2018-09-06

A component that transfers the effects of any ancestor `Timeline` in the hierarchy to the current `GameObject`.

```
Timeline parent { get; }
```

The parent `Timeline` from which time effects are transfered.

```
CacheParent()
```

The timeline hierarchy is cached for performance. If you change the transform hierarchy, you must call this method to update it.

The following members, along with all component timelines, are shared with the `Timeline` class:

- `recordingInterval`
- `CacheComponents`
- `ResetRecording`
- `EstimateMemoryUsage`

Previous

Timeline

A component that combines timing measurements from an observed `LocalClock` or `GlobalClock` and any `AreaClock` within which it is.

Next

Occurence

An event anchored at a specified moment in time composed of two actions: one when time goes forward, and another when time goes backward.
