Tweening

Updated: 2018-09-06

Chronos can be used along many third-party tweening libraries. The following article gives some examples for the most common ones.

DOTween

```
tween.OnUpdate(()=> tween.timeScale = timeline.timeScale);
```

LeanTween

```
LeanTween.dtManual = GetComponent<Timeline>().deltaTime;  
LeanTween.scale(this.gameObject, Vector3.one*3f, 1.0f).setUseManualTime(true);
```

iTween

iTween uses its own custom scripts with Time functions from Unity. You have to replace these with [Chronos equivalents](#).

Do the following changes in **iTween.cs** and it should become compatible with Chronos.

Search: Time.deltaTime

Replace: GetComponent<Timeline>().deltaTime

Search: Time.time

Replace: GetComponent<Timeline>().time

Search: new WaitForSeconds

Replace: GetComponent<Timeline>().WaitForSeconds

Add the Chronos namespace in usings:

```
#region Namespaces
using System;
using System.Collections;
using System.Collections.Generic;
using System.Reflection;
using UnityEngine;
using Chronos;
#endregion
```

Add a require component to the class: (optional, but a good reminder)

```
[RequireComponent(typeof(Timeline))]
public class iTween : MonoBehaviour {
```

Next

PlayMaker →

Chronos integrates with PlayMaker, the popular visual scripting plugin for Unity.
